Users of AutoCAD define a drawing or project using a graphical user interface (GUI). The drawing is stored in the cloud or on the hard drive of the user's computer. The user can then distribute or print copies of the drawing on a personal computer (desktop) using an external printer. In this way, AutoCAD allows many users to collaborate on a single drawing. In addition, AutoCAD is used in a wide variety of industries, including architecture, civil engineering, electrical engineering, industrial design, mechanical design, architectural design, and construction. In November 2019, Autodesk said that it would stop producing AutoCAD 2020. History A development group in the Architecture Department of Stanford

University developed a portable CAD program to analyze and document the construction of the Stanford Linear Accelerator Center in the mid-1970s. The team's program, developed under the name of ARGUS, made use of the University's FLEX (Foundry Logic Editing) programmable digital computer. The program's user interface resembled a plotter, allowing the user to "draw" a 2D design by moving the pen while the computer created the 3D surface. The first version of ARGUS, released in January 1975, was written in the now-obsolete programming language TRS-80 BASIC. The ARGUS team eventually created a system using an inexpensive personal computer, the TRS-80 Model II. ARGUS introduced this version in February 1976. The following month, ARGUS was

ported to the new UCSD Pascal. By December 1976, UCSD Pascal was chosen over ARGUS for its added features, including graphics capabilities. This switch required a large portion of the ARGUS program to be rewritten. ARGUS II was released in 1978. In April 1976, ARGUS was used to design the Stanford Linear Accelerator Center. The first version of the design program to feature a GUI was released in April 1978. This version was designed to function on the new Xerox Alto, released in May 1978. The Xerox Alto was considered a major advance in personal computing at the time, as it was the first computer to be easy to use, reliable, and affordable. At this time, ARGUS was primarily used in the US, although it was also installed in Sweden and Japan. In April 1979,

ARGUS II was released for the Xerox 6000 series. The following year

Raster graphics Raster graphics is the underlying mechanism for adding visual information to a drawing. It consists of a two-dimensional grid of pixels. The pixels may represent a color (monochrome) or a binary value (bitmap). A simple way to picture this is that raster graphics are the smallest (most discreet) pieces of information that can be held by a computer. A CIE color space, consisting of three numbers, can be assigned to each pixel in the raster, and the number can be altered at will. This allows the creation of thousands of colors. The distinction between raster and vector

graphics is that a vector image defines shapes, lines, curves, and points in space, but no pixels are added to represent the vector information. A vector object may be represented in raster form by either a point-to-point connection or a collection of segments. A raster drawing engine can produce both the vector graphics of the shape and a variety of printed media. Usually, a 2D graphics software package like Adobe Illustrator, Microsoft Visio, and CorelDraw uses raster-based display and vector-based editing to create and modify vector drawings. Raster images are used on CAD systems to display technical drawings or block diagrams (also called functional block diagrams).

Vector graphics Vector graphics is a set of two-dimensional, geometric, and mathematical objects, such as line

segments, curves, ellipses, and polygons. Vector graphics is considered to be a subset of 2D vector graphics that can be displayed, modified, and edited in a true vector image editor. A vector image is based on geometric entities, and the entities are connected using a grid-like structure called a vector path. Vector paths connect vectors with each other to form a continuous line. The lines can be curved, broken, and modified. In contrast to raster graphics, vector graphics are not based on the color of the pixels, but rather use a mathematical formula for the color (RGB) of each pixel. In vector graphics, each object has a mathematical description and a predefined location in the graphic area. A point on a path is uniquely defined by its point

coordinates and its direction. A curve is defined by its parametric equation which is a mathematical formula for the coordinates of each point on the curve. Vector graphics can be stored in and edited by a vector-graphics editor. It supports a number of mathematical operations, and displays graphics very quickly compared to r ca3bfb1094

I've

got a simple select statement. I insert data to the table in a loop. So the data I want to insert looks like this. insert into table1 (...) values(...),(...) ... The problem is that every call to my function happens at the same time so i will receive "duplicate key value violates unique constraint" when i run my application. I know that the easiest solution would be to make my function blocking. Then i will have to check if the data is already inserted in the table with a query, but it makes the function more complicated. Also I've read something about the transaction isolation level. If i set it to serialized, would my data be inserted in a transaction? How? A: You can use a DO \$\$ as a local context, and not worry about transactions or locks: DO \$\$ DECLARE insrc cursor for SELECT *

```
FROM table1; BEGIN OPEN insrc; FETCH
NEXT FROM insrc into mydata;
WHILE(FETCH NEXT FROM insrc into
mydata) DO INSERT INTO table1 (... )
VALUES (... ); END WHILE; END; $$
