Tuesday, February 5, 2015 The Ivy League Universities of Australia (AU) has been hit with a lawsuit over its for-profit online colleges. The suit, filed by former students at the university's campuses in Brisbane, Sydney and Perth, claims that the institutions' "false representations" about their students' acceptance rates, graduation rates, and job placement made them "willfully and knowingly false." "The Australian Senate Inquiry into Online Degrees showed that there has been a rise in unqualified and badly trained graduates, many of whom are incapable of fulfilling basic life responsibilities," asserts the lawsuit. The former students are suing the AU for unjust enrichment, negligent misrepresentation, negligence, and breach of contract. The suit continues: "[The AU's] promotional material, including its marketing of its Internet distance education courses to Australian residents, its use of oft-times false projections of expected job placements and employer-recommended salary levels, and its projection of 80 per cent of students' completion of their courses – many of whom suffer from minimal prior academic study or failure to complete their degree courses – have been false." The lawsuit claims that the AU has misled credential-seeking Australians. "[The AU] knowingly and intentionally pursued an endeavor – online education – that it knew would produce large numbers of low-skilled, poorly trained persons for the Australian job market and the Australian economy," the lawsuit reads. "[The AU's] key promotion to most Australians in the form of a six-month free trial of its courses makes it the first and only institution to offer a six-month free trial to such a large group of Australians in any field." The lawsuit notes that AU's Vice President of Student Affairs, Susan De Witt – also sued individually in the case – has "a documented history of racial discrimination within her office." "She has compiled a 'Blacklist' of degrees offered by campuses of the Association of American Universities – a list of a dozen of these universities that are to be avoided," the suit claims. The lawsuit filed by former AU

What's New in the?

A conventional toilet seat device mainly uses a mechanical linkage as a transmission member for coordinating the inclination of a toilet seat with the movements of the occupant's sitting posture and straining movements of the anus and the buttocks. Since the principle of the mechanical linkage occupies a large space, a mechanism is required to increase the number of links to reduce the size of the toilet seat device. However, the mechanical linkage occupies a large space in the toilet seat device, which cannot meet the current requirement in compact toilet seat devices. Although the seat adjusting angle is adjusted by the user's sitting posture, straining movements of the anus and the buttocks, and the like in the conventional toilet seat device, the seat adjustment angle cannot be controlled in an accurate and real-time manner. For example, when the user sits on the toilet, the straining movements of the anus and the buttocks will change the user's sitting posture slightly. As such, even if the seat adjustment angle is regulated and coordinated by the user's straining movements, it is very difficult for the user to accurately coordinate the seat adjustment angle with the straining movements, and thus, the toilet seat device cannot accurately adjust the seat according to the sitting posture of the user. In view of this, it has become an important issue to design a new toilet seat device to overcome the shortcomings and problems of the conventional toilet seat devices described above.Q: How to expand text boxes to accommodate all data?
